

The Register

every parameter the valuation engine runs on, with its provenance · generated 2026-07-08 from the engine's own configuration and assumptions log · seed 20240115 · myopicdelirium.com/instruments

What this document is

Quantitative work usually asserts its legitimacy by volume - large datasets, dense tables, an appendix nobody reads. This document is that appendix, written honestly: instead of using volume to impress, it uses volume to disclose. Every calibrated parameter in the exit simulation appears below with its source quoted verbatim and classified into one of three honesty classes. Every assumption recorded during an engine build is listed. The complete numeric configuration - every knob the engine has - is flattened into the appendix, one row per parameter, nothing omitted. If a number in the engine's output depends on a guess, that guess is on one of these pages, labeled.

The three honesty classes

class	meaning
CITED	the source cites published data with no assumed component
ANCHORED	the source cites published data but marks a level or interpolation ASSUMED - grounded, not measured
ASSUMED	a labeled guess. It is in the model because a value is required and no defensible citation exists yet; the methodology gate exists to retire these

The audit, counted

Of the 17 calibrated exit-parameter groups: 0 cited, 14 anchored, 3 assumed. The engine computes this census of itself on every build and ships it in the assumptions register; the same counts appear in the Stage 4 build report. A document like this one is only trustworthy if it can get worse - if new parameters arrive as ASSUMED and are shown as such.

I · The exit calibration, in full

The forward simulation rests on these groups: stage-conditional exit-type probabilities, age-conditional Weibull exit timing, lognormal exit multiples on last-round post-money, and the Gaussian-copula loadings that control how much diversification a book really has. Sources verbatim.

stage	exit-type probabilities (sum = 1)	class	source, verbatim
SEED	IPO 0.010 · trade sale 0.150 · secondary 0.040 · stay private 0.250 · down round 0.150 · write-off 0.400	ANCHORED	Anchored: Correlation Ventures realized US VC outcomes 2004-2013 (~65% of financings return <1x); CB Insights seed-cohort funnels. Per-type split at this stage ASSUMED.
SERIES_A	IPO 0.020 · trade sale 0.220 · secondary 0.050 · stay private 0.250 · down round 0.160 · write-off 0.300	ANCHORED	Anchored: Correlation Ventures outcome distribution; PitchBook-NVCA Venture Monitor exit composition (acquisitions dominate exit count, IPOs a small minority). Per-stage interpolation ASSUMED.
SERIES_B	IPO 0.040 · trade sale 0.280 · secondary 0.070 · stay private 0.240 · down round 0.150 · write-off 0.220	ANCHORED	Anchored: PitchBook-NVCA exit composition; failure rates decline with stage (Correlation Ventures). Per-stage interpolation ASSUMED.
SERIES_C	IPO 0.070 · trade sale 0.320 · secondary 0.080 · stay private 0.220 · down round 0.140 · write-off 0.170	ANCHORED	Anchored: PitchBook-NVCA exit composition by stage. Per-stage interpolation ASSUMED.
GROWTH	IPO 0.120 · trade sale 0.340 · secondary 0.100 · stay private 0.200 · down round 0.120 · write-off 0.120	ANCHORED	Anchored: late-stage exit rates and IPO share rise with maturity (PitchBook-NVCA). Per-stage interpolation ASSUMED.
PRE_IPO	IPO 0.220 · trade sale 0.300 · secondary 0.120 · stay private 0.180 · down round 0.100 · write-off 0.080	ANCHORED	Anchored: pre-IPO cohorts show the highest IPO incidence; residual failure remains non-trivial (PitchBook-NVCA). Split ASSUMED.

stage	Weibull time-to-exit	class	source, verbatim
SEED	shape 1.50, scale 8.00 y	ANCHORED	Anchored: PitchBook median time from first VC financing to exit ~5.3-6.9y; rising hazard consistent with VC duration studies (Giot & Schwienbacher 2007). Stage scale interpolation and shape value ASSUMED.
SERIES_A	shape 1.50, scale 7.00 y	ANCHORED	Anchored: PitchBook median holding periods; shape ASSUMED (see SEED row).
SERIES_B	shape 1.50, scale 6.00 y	ANCHORED	Anchored: PitchBook median holding periods; shape ASSUMED (see SEED row).
SERIES_C	shape 1.50, scale 5.00 y	ANCHORED	Anchored: PitchBook median holding periods; shape ASSUMED (see SEED row).
GROWTH	shape 1.60, scale 4.00 y	ANCHORED	Anchored: late-stage positions exit faster (PitchBook); values ASSUMED.
PRE_IPO	shape 1.80, scale 2.50 y	ANCHORED	Anchored: pre-IPO time-to-liquidity typically 1-3y; values ASSUMED.

exit type	multiple on last post-money (log)	class	source, verbatim
IPO	mu_log +0.920, sigma_log 0.600	ANCHORED	Anchored: IPO step-ups over last private round are typically well above 1x (PitchBook up-round step-up medians ~1.4-1.8x between rounds; IPO step-ups higher). Level and dispersion ASSUMED.
TRADE_SALE	mu_log +0.590, sigma_log 0.550	ANCHORED	Anchored: acquisition step-ups over last round; median up-round step-up data (PitchBook). Level and dispersion ASSUMED.
SECONDARY	mu_log +0.100, sigma_log 0.350	ASSUMED	ASSUMED: secondaries trade near or modestly above last round with a discount range; no clean published distribution used.
DOWN_ROUND	mu_log -0.510, sigma_log 0.350	ASSUMED	ASSUMED magnitude (mean ~0.6x). Down-round frequency is anchored (PitchBook/Cooley ~15-20% of rounds) but the severity distribution is a guess.
copula loadings	type 0.45, time 0.35, multiple 0.25	ASSUMED	ASSUMED. No published estimate of exit-window co-movement at this granularity; kept coherent with the Stage 3 common-factor variance weight (0.40). This is the single most important parameter in the stage — it controls how much diversification the book really has.

II · The assumptions register — one engine build, fully logged

Every assumption a module recorded while the engine and its synthetic reference data were built at seed 20240115: 26 entries, append-only, grouped by module. Synthetic-data entries are planted ground truth - later stages are tested on recovering them, which is what makes the synthetic book a control rather than a decoration.

module · exits.assumptions (18)

name	value	units	source
exits.proBABILITIES.SEED	IPO 0.01, TRADE_SALE 0.15, SECONDARY 0.04, STAY_PRIVATE 0.25, DOWN_ROUND 0.15, WRITE_OFF 0.4	probability	Anchored: Correlation Ventures realized US VC outcomes 2004-2013 (~65% of financings return <1x); CB Insights seed-cohort funnels. Per-type split at this stage ASSUMED.
exits.proBABILITIES.SERIES_A	IPO 0.02, TRADE_SALE 0.22, SECONDARY 0.05, STAY_PRIVATE 0.25, DOWN_ROUND 0.16, WRITE_OFF 0.3	probability	Anchored: Correlation Ventures outcome distribution; PitchBook-NVCA Venture Monitor exit composition (acquisitions dominate exit count, IPOs a small minority). Per-stage interpolation ASSUMED.
exits.proBABILITIES.SERIES_B	IPO 0.04, TRADE_SALE 0.28, SECONDARY 0.07, STAY_PRIVATE 0.24, DOWN_ROUND 0.15, WRITE_OFF 0.22	probability	Anchored: PitchBook-NVCA exit composition; failure rates decline with stage (Correlation Ventures). Per-stage interpolation ASSUMED.
exits.proBABILITIES.SERIES_C	IPO 0.07, TRADE_SALE 0.32, SECONDARY 0.08, STAY_PRIVATE 0.22, DOWN_ROUND 0.14, WRITE_OFF 0.17	probability	Anchored: PitchBook-NVCA exit composition by stage. Per-stage interpolation ASSUMED.
exits.proBABILITIES.GROWTH	IPO 0.12, TRADE_SALE 0.34, SECONDARY 0.1, STAY_PRIVATE 0.2, DOWN_ROUND 0.12, WRITE_OFF 0.12	probability	Anchored: late-stage exit rates and IPO share rise with maturity (PitchBook-NVCA). Per-stage interpolation ASSUMED.
exits.proBABILITIES.PRE_IPO	IPO 0.22, TRADE_SALE 0.3, SECONDARY 0.12, STAY_PRIVATE 0.18, DOWN_ROUND 0.1, WRITE_OFF 0.08	probability	Anchored: pre-IPO cohorts show the highest IPO incidence; residual failure remains non-trivial (PitchBook-NVCA). Split ASSUMED.
exits.weibull.SEED	shape 1.5, scale 8	years (scale)	Anchored: PitchBook median time from first VC financing to exit ~5.3-6.9y; rising hazard consistent with VC duration studies (Giot & Schwenbacher 2007). Stage scale interpolation and shape value ASSUMED.
exits.weibull.SERIES_A	shape 1.5, scale 7	years (scale)	Anchored: PitchBook median holding periods; shape ASSUMED (see SEED row).
exits.weibull.SERIES_B	shape 1.5, scale 6	years (scale)	Anchored: PitchBook median holding periods; shape ASSUMED (see SEED row).
exits.weibull.SERIES_C	shape 1.5, scale 5	years (scale)	Anchored: PitchBook median holding periods; shape ASSUMED (see SEED row).
exits.weibull.GROWTH	shape 1.6, scale 4	years (scale)	Anchored: late-stage positions exit faster (PitchBook); values ASSUMED.
exits.weibull.PRE_IPO	shape 1.8, scale 2.5	years (scale)	Anchored: pre-IPO time-to-liquidity typically 1-3y; values ASSUMED.
exits.multiples.IPO	mu_log 0.92, sigma_log 0.6	log multiple on last-round post-money	Anchored: IPO step-ups over last private round are typically well above 1x (PitchBook up-round step-up medians ~1.4-1.8x between rounds; IPO step-ups higher). Level and dispersion ASSUMED.
exits.multiples.TRADE_SALE	mu_log 0.59, sigma_log 0.55	log multiple on last-round post-money	Anchored: acquisition step-ups over last round; median up-round step-up data (PitchBook). Level and dispersion ASSUMED.

name	value	units	source
exits.multiples.SECONDARY	mu_log 0.1, sigma_log 0.35	log multiple on last-round post-money	ASSUMED: secondaries trade near or modestly above last round with a discount range; no clean published distribution used.
exits.multiples.DOWN_ROUND	mu_log -0.51, sigma_log 0.35	log multiple on last-round post-money	ASSUMED magnitude (mean ~0.6x). Down-round frequency is anchored (PitchBook/Cooley ~15-20% of rounds) but the severity distribution is a guess.
exits.copula_loadings	type_loading 0.45, time_loading 0.35, multiple_loading 0.25	-	ASSUMED. No published estimate of exit-window co-movement at this granularity; kept coherent with the Stage 3 common-factor variance weight (0.40). This is the single most important parameter in the stage — it controls how much diversification the book really has.

III · Appendix — the complete configuration, flattened

All 450 configuration values the engine loads, as dotted paths - the full contents of the typed configuration, including every numeric parameter, every label, every cap and limit. This is deliberately exhaustive: the reader who wants to know whether a number exists that is not disclosed can check that it does not.
