

The Quarterly Mark

SAMPLE EDITION — a fictional six-holding book, marked by the live engine · prepared by the desk at myopicdelirium.com · seed 20240115, bit-reproducible · every figure is engine output

The book, in one paragraph

Six private holdings. At your own marks the book carries at **47.0M** (five holdings self-marked; one held at cost). The engine's independent view is **33.9 - 46.4M** (central 40.3M, 90% credible band, correlated aggregation) — never a lone number. Forward, the base calibration puts median TVPI at **1.51x**; the probability of clearing 15% IRR spans **19% - 54%** across the three calibration sets, and that range is the honest answer.

Book NAV — 90% credible band, correlated aggregation

Against your own numbers (M)

Position by position

holding	engine band (M)	central	DLOM	your mark	gap	driver
Norrskén Health AB	6.98 - 11.83	9.34	44%	7.0	+33.4%	comps
Fjordpay AS	2.67 - 7.04	4.45	53%	5.5	-19.2%	dlo
Kompass Logistik GmbH	8.52 - 11.10	9.62	36%	12.0	-19.8%	dlo
Baltika Grid Oy	1.58 - 11.27	6.82	26%	16.0	-57.4%	comps
Verkstad Robotics AB	1.53 - 3.96	2.52	53%	(cost)	-	-
Nordlicht Interactive GmbH	4.96 - 8.82	6.53	44%	6.5	+0.5%	comps

The gap column is the engagement in miniature: where your mark and the engine's disagree, the driver says whether comparables or illiquidity is doing the cutting. Baltika Grid carries the book's largest write-down — a mid-stack Series C position marked off a growth-stage comps set that no longer supports the Series D price.

Two payoff structures your spreadsheet is not computing

Nordlicht's Series B participates without a cap — it takes its preference and then rides the equity, so its curve never flattens. Baltika's Series C sits behind 55M of senior preference: nothing arrives until the Series D is made whole. Both curves are exact, kink by kink, from the cap tables.

Nordlicht Interactive GmbH

Baltika Grid Oy

Forward — as distributions, never as promises

Forward TVPI — median 1.51x (base set)

P(IRR >= 15%) across calibrations

J-curve — distributions as fan

IRR is deliberately demoted (annualization makes its tail unstable): median 8.5%, interquartile 0.7% to 27.3%. There is no mean IRR anywhere in this report, by design.

Risk — what six holdings really are

Risk contribution (sigma 22.3% p.a.)

Correlation, denoised — 5.1 effective bets

Expected liquidity (share of NAV)

Correlation structure proxied from the reference market's sector baskets — pasted comparables carry no price history (live history is a private-tier capability).

What this rests on (the register, in brief)

Of the 17 calibrated exit-parameter groups behind the forward simulation: 0 cited, 14 anchored to published data, 3 assumed and labeled as such. The full register — every parameter, source verbatim — is public at myopicdelirium.com/instruments/register. A desk that hides its assumptions is selling you its optimism; this one publishes them.

Reproducibility

Seed 20240115. Re-running this book with the same inputs returns these numbers bit-identically — the mark is auditable, not an anecdote. Oracle: Every cap table in this book passed the same invariants the engine's own test suite must pass.

SAMPLE — all six holdings, their cap tables, marks and comparables are fictional. A live engagement produces this document quarterly on your actual book, on a private instance of the engine that only you can reach. Decision support with disclosed assumptions; not a valuation of record, not investment advice. Engagements: myopicdelirium.com/instruments/desk
