

# The Desk

a private marking engagement · quarterly independent marks on your private book · [myopicdelirium.com/instruments/desk](https://myopicdelirium.com/instruments/desk) · 2026-07-10

## The problem, stated plainly

Private holdings are marked by the people who hold them, and those marks drift optimistic. If you hold direct positions — as an angel, a founder with stakes in others' companies, a family holding company — your book is probably carried at whatever the last round said, held together by a spreadsheet that has never once computed your liquidation waterfall. Between that spreadsheet and an institutional valuation firm at five figures per position per year, there has been nothing.

## What the desk is

The desk runs your book through the valuation engine at [myopicdelirium.com/instruments](https://myopicdelirium.com/instruments) — the same engine demonstrated publicly, on a **private instance provisioned for you alone**. Each quarter you receive an independent, market-referenced mark for every position: built from comparables, a defensible marketability discount, and the exact payoff structure of your share class through the liquidation waterfall — then reported honestly, as a credible band, never a lone number, with every forward claim spanning three calibration sets.

## What you receive

| deliverable           | what it is                                                                                                                                                                                                                                                               |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The Quarterly Mark    | the report: book NAV with its band, position-by-position marks with the gap against your own carrying values and what drives each gap, your payoff curves, forward distributions, the risk view, and the method notes verbatim. See the sample edition on the desk page. |
| Your private terminal | an access-coded instance of the live terminal holding your book — rerun it yourself between quarters, stress it, change assumptions, export everything. Same seed, same result, bit-identically: the marks are auditable.                                                |
| The register          | every parameter behind your marks, with its source and honesty class (cited / anchored / assumed) — public at <a href="https://myopicdelirium.com/instruments/register">/instruments/register</a> . A desk that hides its assumptions is selling you its optimism.       |

## How it starts

You provide, per holding: the cap table (classes, preferences, participation, shares), the last round's economics, your current carrying value, and — if you have them — the comparables you consider fair. Where you don't, the desk proposes a peer set for your approval; nothing is marked off a reference you haven't seen. The baseline mark and first report arrive within ten business days of complete inputs.

## Custody, in one paragraph

Your book lives on a deployment that exists only for you, behind your own access code, in EU jurisdiction (Stockholm region). No accounts; request bodies are never logged; the only stored artifact is a computation cache keyed by input hash. You can export your book as a file at any time, and on termination the instance is destroyed and its cache cleared. The engagement owns nothing of yours.

# Pricing

flat, quarterly, cancel anytime — the engineering is in the engine, not the bill

| engagement                                     | price               | covers                                                                                                                                                                                                                                               |
|------------------------------------------------|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Onboarding (one-time)                          | EUR 1,500           | book build and validation, peer sets proposed and pinned, private instance provisioned, baseline mark, first report                                                                                                                                  |
| The desk, quarterly — books to 8 holdings      | EUR 1,200 / quarter | the re-mark, The Quarterly Mark, one working session on the results, instance hosting and code rotation                                                                                                                                              |
| The desk, quarterly — books to 15 holdings     | EUR 2,000 / quarter | as above                                                                                                                                                                                                                                             |
| The Waterfall Report (one-off, single holding) | EUR 450             | the exact payoff structure of your class — every kink, the preference threshold, your proceeds at any exit value — plus a mark with its band. The entry product: most useful in the quarter you are deciding whether to sell, exercise, or follow on |

## Anchors, stated honestly

A single-company 409A valuation runs roughly USD 2,000 - 5,000 per year. Institutional independent fair-value opinions run five figures per position per year. A spreadsheet is free, and does not know what a participation cap does to your proceeds. The desk prices an eight-holding book at EUR 6,300 in year one — independent marks each quarter on every position, for less than one institutional opinion on one position.

## What this is not

The desk is **decision support with disclosed assumptions** — it is not a valuation of record, not an audit opinion, and not investment advice. The engine's calibration register is public, including which parameters are assumed rather than cited; engagements inherit every improvement as the validation roadmap (independent methodology review, vendor data QA) closes. If you need a mark an auditor will sign, the desk will tell you so and tell you who to call.

## Engage

Via Connect at [myopicdelirium.com](https://myopicdelirium.com) — describe the book in one paragraph (how many holdings, what stages, whether you carry self-marks). You will get a straight answer about fit within two business days.

---

The sample report (a fictional six-holding book, marked by the live engine) and this letter are both at [myopicdelirium.com/instruments/desk](https://myopicdelirium.com/instruments/desk).
